

## Link List | Developer Documentation

### Instructions on how to compile install and run LinkList:

#### **Running and Compiling on Windows:**

1. Install Android Studio
2. Pull our code from the Git repository
3. Open project in Android Studio
4. Either compile and run the code on an android device you have plugged into your computer (by enabling USB debugging) or by running it on an emulator. To run it on an emulator, click compile and when given the option, create a new virtual device. The app should run on that.

#### **Running and Compiling on Android:**

1. Use an Android device that is running at least Android 4.0 (Ice Cream Sandwich)
2. Download the apk that is also stored on git
3. Make sure you allow third party apps to be installed on your phone under General>Security>check the box labeled Unknown Sources
4. Install application and Run.
